

What I claim as my invention is:

1. A cleaning apparatus comprising:
  - (a) a brush head having two surfaces, a top surface and a bottom surface, the brush head preferably being approximately eight inches in length and approximately three to five inches in width, the brush head having two ends, a first end and a second end, the brush head having a pair of sides, a first side and a second side,
  - (b) a hole located on the top surface of the brush head, the hole being located near the second side of the brush head approximately halfway between the first end and the second end,
  - (c) a pole having two ends, a first end and a second end, the first end of the pole being removably inserted into the hole,
  - (d) a plurality of bristles attached to the bottom surface of the brush head, and
  - (e) a rubber blade attached lengthwise to the top surface of the brush head near the first side of the brush head.
2. A cleaning apparatus according to claim 1 wherein the pole would be approximately three to four feet long.
3. A cleaning apparatus according to claim 1 wherein the height of the brush head combined with the length of the plurality of bristles would be approximately three to four inches.
